

BUMBLE

SQUIRE OF THE SWARM

Looks like a mess. Gets the job done.

A community token launched through a Mosh bundle on Robinhood Chain.
$BUMBLE · November 2026

Meet Bumble

Bumble is the squire nobody would pick: crooked helmet, dented armor, one bent wing. He looks like he's about to ruin everything. Then he points his sword, the Swarm moves with him, and the job gets done. Every time.

LOOKS	LEADS	RESULT
Like a mess	**The Swarm**	**The bag stays locked**

The problem: launches get dumped

In the Trenches, most new tokens die the same way. Whoever holds the opening supply, the dev or a bundle of insider wallets, waits for buyers to show up, then sells into them.

Bumble's dented armor came from a knight who lost to exactly that. He's not letting it happen again.

THE FIX

Nobody holds the opening supply. Not the creator, not the backers, not Mosh.

The Swarm: AI agents that hold the line

Bumble's bees are Mosh's AI agent swarm, the same system that has run Bundle Cat's ($BUN) bundle since September. When the bundle fills, the opening supply goes to the Swarm's three agent vaults, and what goes in can never come out.

Locked forever	No one can withdraw the supply: not the creator, not the backers, not Mosh.
One pool only	The agents trade only against $BUMBLE's own pool.
Rate-limited	They can move only so much per hour, so there's no single big dump.
Make the market	They provide liquidity and use part of the raise, held back for them, to bid.

In the lore, Bumble leads the Swarm. In the contracts, nobody does: the agents run on fixed rules.

How the bundle works

1

Fill the bundle

Anyone can fund it from their own wallet, any amount, during a 72-hour window. No sign-up needed.

2

Fill or refund

If the target isn't met by the deadline, every contributor gets their contribution back.

3

Launch

The filling transaction creates $BUMBLE on Pons, buys the opening supply and hands it to the Swarm. Mosh takes a one-time 5% launch fee.

4

Fees flow to backers

Every trade pays a fee. Backers get their share, pro-rata, in the pair asset, for as long as $BUMBLE trades.

Raise window	**72 hours**
Team allocation	**0%**
Who can fund	**Anyone (open raise)**

No sign-up, no whitelist and no per-wallet cap. The target, trading fee and pair asset are announced before the raise opens.

Why Bumble

Volume is the engine. The Swarm keeps the market fair; Bumble gives people a reason to keep showing up.

No dev bag

The opening supply sits with the Swarm, so there's no insider wallet waiting to sell on holders.

Market makers from day one

AI agents provide liquidity and bid on weakness, inside fixed limits.

No bags to dump

Backers fund the launch but never receive tokens, so there is nothing for them to sell on holders.

A character that makes content

Every chart move is a Bumble story, which keeps people talking, sharing and trading.

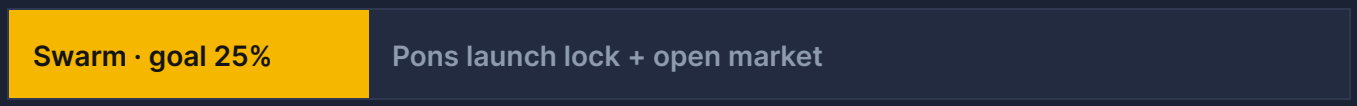
A community start

Open to anyone. Started by the DADS DeFi Space and MaxFi communities, with every backer holding their own claim on-chain.

$BUMBLE is a meme coin built for community and culture. It has no intrinsic value and no promised return. See page 10 before you fund.

Tokenomics

No team allocation and no presale bag. The raise buys the opening supply for the Swarm, and the size of the raise decides how big that share is.



Exact split set at launch by raise size and Pons

Total supply confirmed at launch

The Swarm (goal ~25%)

Locked forever in the agent vaults. A bigger raise buys a bigger share: Aurum's Swarm holds 30.7%, Bundle Bat's 9.8%.

Pons launch lock

Pons permanently locks launch liquidity, so it can't be pulled.

Open market

Everything else trades freely from day one. No one starts with a bag.

0% team allocation

No reserved tokens. The organizer buys like everyone else.

What $BUMBLE does today, the planned MaxFi LP and the utility ideas we're exploring are on the next page: **Utility & roadmap**.

Utility & roadmap

Live means you can use it today. At launch means it switches on when $BUMBLE goes live. Planned means we intend to do it. Exploring means we're working through it, not promising it.

Utility

LIVE	**Meme Forge.** Make and download Bumble memes in the browser.
LIVE	**B-Pong arcade.** Bumble's sword against the Crypto Bro and his gold chain, with shareable scores.
AT LAUNCH	**Swarm market making.** Three AI agent vaults hold the opening supply forever and bid on weakness, inside fixed limits.
AT LAUNCH	**Backer fee share.** Backers get a pro-rata share of trading fees. It may be little or nothing.
PLANNED	**MaxFi LP.** A community liquidity position on MaxFi after launch to deepen the market.
EXPLORING	**Fee burn.** Using part of the fees $BUMBLE earns to buy and burn supply.
EXPLORING	**Staking locker.** A locker on Pantheon so holders can stake $BUMBLE for rewards.
EXPLORING	**LP fee burns.** Burning fees earned by the MaxFi position to shrink supply over time.

Roadmap

1 Raise

Target, fee and pair announced, then a 72-hour open raise on Mosh. Anyone, any amount, fill or refund.

2 Launch

$BUMBLE goes live on Pons and the Swarm takes the opening supply. Contract pinned on the site, X and Telegram.

3 Liquidity

The MaxFi community LP (planned) deepens the market.

4 Utility

Fee burn, a Pantheon staking locker and LP fee burns (exploring), while memes and the arcade keep the Swarm busy.

Marketing & community memes

Bumble grows the way a meme coin should: the community makes the content. Every chart move is a Bumble story. No paid hype and no fake urgency.

How the word gets out

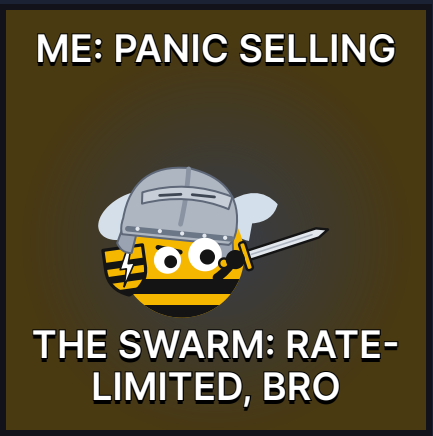
Community first
Started with the DADS DeFi Space and MaxFi communities, then open to everyone.

X and Telegram
@Bumsquire and the Bumble Telegram carry lore drops, raise updates and Swarm reports.

Meme Forge
Anyone can make a Bumble meme in seconds on the website and post it.

Swarm Arcade
B-Pong scores are made to be shared, which keeps people coming back.

Community memes



Swarm meme rules

- Tag @Bumsquire so the Swarm sees it.
- Keep it fun. No price promises, no "guaranteed" anything.
- Share official links only: the website, @Bumsquire and the pinned Telegram post.

Memes are for fun. $BUMBLE is a meme coin, not an investment.

Read before you fund

Your contribution is locked for good

Contributions can never be withdrawn, and a stake can't be sold or transferred.

Fees are the only return

At a 2% fee, backers break even after about 75 times the raise in trading volume, so a bigger raise needs more volume. The raise is open with no wallet cap, so a few large backers could hold most of the fee share. Most launches never get there.

New, unproven tech

Mosh, its agents and Robinhood Chain are all new, and smart contracts can fail or behave in unexpected ways.

Roadmap ideas aren't promises

The MaxFi LP, fee burns and staking are plans or ideas. They may change or never launch.

Memecoins can go to zero

Only put in an amount you're comfortable never seeing again.

Settings can change

Everything here is a proposal and will be confirmed against Mosh's create-bundle form before the raise opens.

Disclosure: DADS DeFi Space organizes this raise, will contribute to it, takes a 0% team share, and holds BUN and AUR, two Mosh ecosystem tokens.
